

A missed call should not be a missed job.

Catch the call. Capture the details.
Put the next step in your office's hands.

Start with after-hours or overflow intake, not a new dispatch system.

What happens when nobody can pick up?

Walk through the last call that went to voicemail.

01

The caller needs help

You are on a service call.
The office is busy. It is after hours.

02

The details are missing

Who called? Where is the job? What is wrong? How urgent is it?

03

The callback slips

Who owns the callback, and did it turn into a booked job?

If your current phone process already handles this well, do not buy another layer.

AI intake that captures, not guesses.

Begin with callback requests. Add booking only if your system and rules support it.

CALL COMES IN

Answer or capture

Use your greeting. Keep a human route. Test what happens if the tool fails.

DETAILS GO IN

Collect the essentials

Name, number, job address, problem, urgency and access details.

OFFICE TAKES OVER

Make a callback task

Send a summary to your team. Track the callback and booking outcome.

Exact channels, software, availability and handoff must be checked before setup.

Your team still makes the calls.

Agree on the exceptions before the first live caller.

The assistant can

Capture and summarize the request.
Use only answers you approve.
Flag urgent or unclear calls.

Your team decides

Diagnosis, price and dispatch.
Promised arrival times.
Safety issues and complaints.

Test the human fallback, data access and shutdown path. No autonomous diagnosis or dispatch.

Count profit from extra jobs, not ticket sales.

Illustration only. Replace these assumptions with your own numbers.

ASSUMED GROSS PROFIT PER EXTRA JOB

\$200

After direct job costs.

Only jobs you would otherwise have lost.

With optional monthly support

\$350 support + \$50 assumed software
= \$400 per month = 2 extra jobs

First month: \$750 setup + \$400
= \$1,150, or 6 extra jobs at \$200 each.

Not a forecast or client result. Actual software/usage and extra staff time change the break-even point.

Start small. Know what you are paying for.

One-workflow setup

\$750

One agreed workflow.

Templates and a simple instruction sheet.

A training call and one revision round.

Optional support

\$350 / month

Monthly review, minor changes and fixes.

Up to one hour of support per month.

New workflows are separate projects.

Software/usage paid by you. Receptionist fit checked first; custom integrations quoted separately.

Check the records. Test one handoff. Review it.

01 / CHECK

Find the real gap

Review recent call logs and callback outcomes. Check the features you already pay for.

02 / TEST

Keep it supervised

Agree scope and exceptions. Test sample calls, then a small approved live run. Leave clear instructions.

03 / REVIEW

Keep it only if it earns it

Compare captured calls, callback speed, extra booked jobs, errors and costs against your baseline.

Use your own job margins. If the records do not support the cost, do not expand the workflow.

Show me where calls fall through the cracks.

No new software to buy before we check the fit.

Who answers when everyone is out?

What happens after hours?

How do you know a missed call became a job?
